

DEPARTMENT OF SCIENTIFIC INTELLIGENCE

FIELD OPERATIONS & RECOVERY DIVISION • ARCHIVE UNIT 7

DECLASSIFIED

DOCUMENT ID: ARC-1978-AUR-09B

DATE OF ORIGIN: NOVEMBER 14, 1978

SUBJECT: PROJECT AURORA - TEST SITE BRAVO
EVALUATION

PREPARED BY: DR. ARTHUR M. VANCE ([REDACTED])

1. EXECUTIVE SUMMARY & SITE ASSESSMENT

Preliminary physical examination of Site Bravo following the high-frequency radiation test run indicates [REDACTED] of structural telemetry units. All monitoring instruments within a 400-meter radius exhibited severe signal drift prior to complete channel blackout at 04:12 GMT.

The recovered recording canisters show heavy environmental exposure, including salt-water intrusion and thermal degradation. Primary core samples remain intact, though secondary telemetry reels suffered partial magnetic erasure due to localized pulse fields.

2. SENSOR READINGS & ANOMALY TELEMETRY LOG

Timestamp	Sensor Vector	Recorded Amplitude	Variance Shift	Status / Notes
04:08:12	VEC-NORTH-01	14.22 mR/h	+0.04%	Baseline Nominal
04:09:45	VEC-NORTH-01	88.90 mR/h	+525.10%	Thermal Spike Observed
04:11:02	VEC-WEST-04	[REDACTED]	CRITICAL	Sensor Housing Cracked
04:11:59	VEC-CORE-00	OVERFLOW	N/A	Signal Termination

3. PHYSICAL ARTEFACT INSPECTION NOTES

Visual inspection of the primary housing enclosure revealed substantial surface scoring along the northern seal. Dark particulate residue ([REDACTED]) was gathered from the main flange for spectrographic assay.

Recommendations for immediate action: Enclose all recovered magnetic media in lead-lined transfer cases immediately. Personnel handling Site Bravo logs must maintain standard Level 3 protective gear until radiological decontamination is finalized.
